For re03qt, we did not switch to inverted recording at C-band, since it did not give the expected result anyway. As before, I used DAS profile at16x2_n (no inversion, for L-band) for the whole recording. The C-band data will need to be manipulated to give the correct band inversion and channel order. (The channel ordering in re03qt at C-band only will be different from the previous two days observation, because "inverted recording" was not selected, whereas for re03qr and re03qs it was.)
