

Recording data to ATNF V005A, which is /data/xraid1 on cavsi1.

For non-ICRF modes we are recording DAS2 only.

The tied-array is 1234 as requested, with CA03 as reference on W104.

CABB block 27 dropped out at 19:18 UTC, but wasn't caught until 20:05, at which point it was fixed. During this period, the correlator was not forming the zoom band that becomes the tied array, but I don't actually know what effect this has on the tied array output. Normal data resumed at 20:06 UTC.
