

# ATNF Synthesis Imaging Workshop

## Correlators ( Backend System )

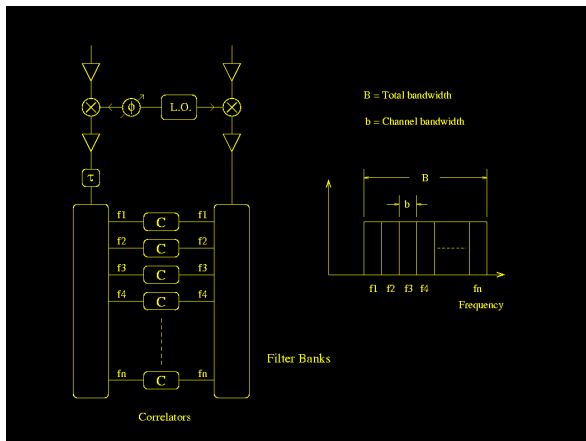

Warwick Wilson, ATNF.

### Advantages of measuring the Cross Power Spectrum

- Allows measurement of any frequency dependence in the source, e.g. spectral lines.
- Reduces the effects of frequency smearing and provides more independent measurements on the U,V plane. (MFS)
- Provides an easy method of delay calibration.
- Interference excision.

### Visibility / Cross Power

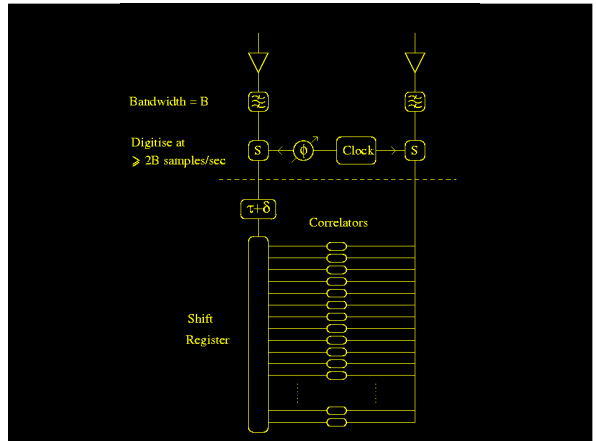

$$V = \langle E_1(t) \bullet E_2(t) \rangle$$

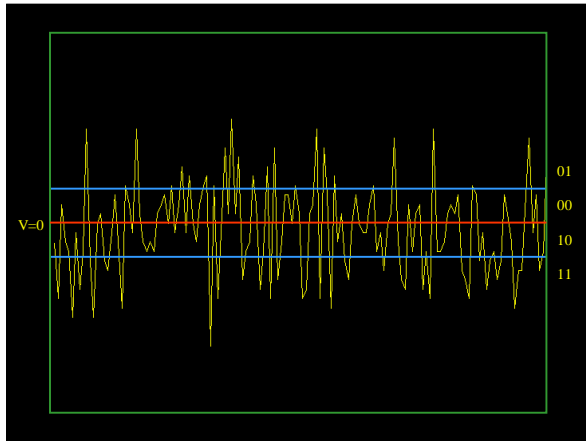

$$C(\tau) = \langle E_1(t) \bullet E_2(t + \tau) \rangle$$

$$C(\tau) = \int V(f) e^{2\pi i f \tau} df$$

$$V(f) \Leftrightarrow C(\tau)$$

Cross Power Spectrum -- Cross Correlation Function

Bits	Levels	Efficiency
1	2	0.64
2	4	0.88
